MINING EQUIPMENT

The **WD300 wet duster** is carried in a scoop bucket and powered by the scoop hydraulic PTO.

12 GPM and 1,500 psi is needed for the duster to operate properly.

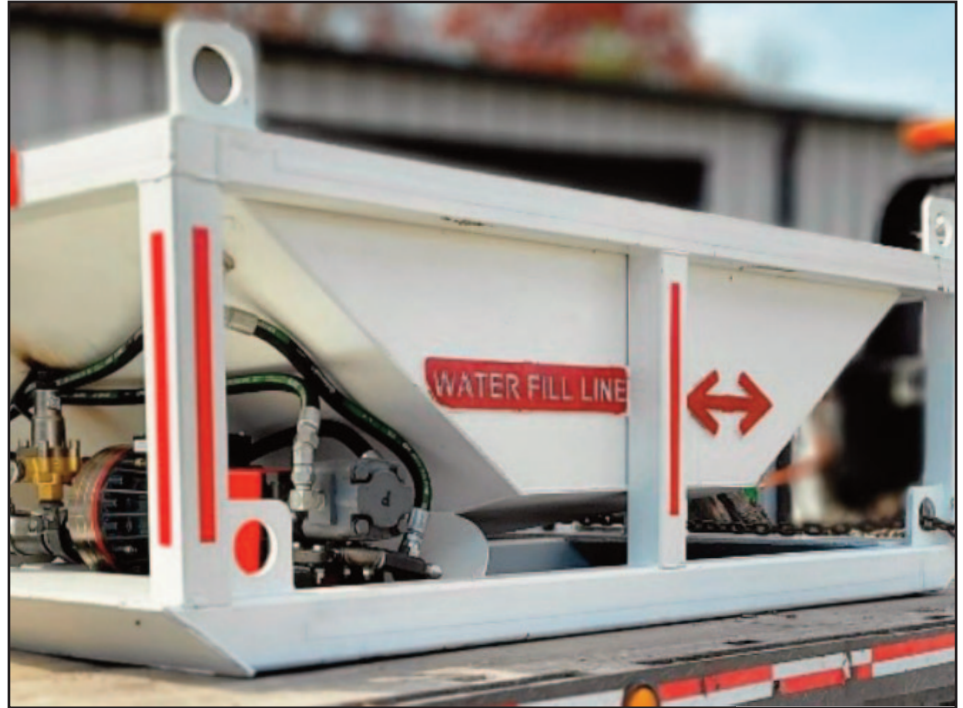

Wet rock dust, or slurry, is a combination of water and rock dust. Water is stored in the hopper while rock dust is added and mixed into a slurry by means of (2) hydraulically operated mixers.

Wet rock dusting allows operators to dust on-shift with workers inby, reducing the hazards associated with respirable dust.
